OPTIONAL: History and Examination Prior to Starting ADHD Medication

Psychostimulant medication is a common treatment recommendation following a diagnosis of ADHD. Blood pressure, pulse and cardiac auscultation are recommended prior to a stimulant start. In addition, an ECG is sometimes recommended (e.g. in patients taking a tricyclic antidepressant, on other medication that might prolong the QT interval, etc.).

Please complete the following to help the consulting physician determine what investigations may or may not be needed.

Shortness of breath with exercise (more than others of the same age) in the absence of an alternate explanation (e.g. asthma, sedentary lifestyle, obesity)	□ No	☐ Yes
Poor exercise tolerance (in comparison with others) in the absence of an alternate explanation (e.g. asthma, sedentary lifestyle, obesity)	□ No	☐ Yes
Fainting or seizures with exercise, startle or fright	□ No	☐ Yes
Palpitations brought on by exercise	□ No	☐ Yes
Family history of sudden or unexplained death including sudden infant death syndrome, unexplained drowning or unexplained motor vehicle accidents (in 1st or 2nd degree relatives)	□ No	☐ Yes
Personal or family history (1st or 2nd degree relatives) of non-ischemic heart disease such as: • Long QT syndrome or other familial arrhythmias • Wolff-Parkinson-White syndrome • Cardiomyopathy • Heart transplant • Pulmonary hypertension • Unexplained motor vehicle collision or drowning • Implantable defibrillator	□ No	☐ Yes
